

CSC340:

Dynamic Arrays in a Class--"The Big Three"

Main Topics:

1. The big three: destructor, copy constructor and overloaded assignment operator
2. Advanced topic: the move constructor

Readings:

1. 5th Edition: pages 194--199 (copy constructor and destructor, pages 428--430 (overloaded assignment operator)

1

The Big Three

- **Required if a class includes a data member that requires dynamic memory allocation and management such as a dynamic array or a linked list**
 - this class **MUST** include the "big-three"
- **What are the "big-three"?**
 - The copy constructor
 - The assignment operator
 - The destructor
- **If you need to define one, you need to define all**

Slide 8- 2

Program Example

- **The Student class**

- Dynamic data members

```
string* email_list;
```

```
int num_emails;
```

```
double *grade_list;
```

```
int num_grades;
```

- The big-three

```
~Student(); //destructor
```

```
Student(const Student& ); //copy constructor
```

```
Student operator=(const Student& rhs); //assignment
```

Slide 8- 3

Destructor

- **A destructor is a member function that is called automatically when an object of the class goes out of scope**

- Contains code to delete all dynamic variables created by the object

- A class has only one destructor with no arguments

- The name of the destructor

- Example: `~Student();`

- **Why destructor?**

- Dynamic variables do not "go away" unless *delete* is called
- A user of the Student class could not know that a dynamic array is a member of the class, so could not be expected to call *delete* when finished with a Student object

Slide 8- 4

Copy Constructors

- **A copy constructor is a constructor with one parameter of the same type as the class**
 - The parameter is a call-by-reference parameter
 - The parameter is usually a constant parameter
 - The constructor creates a complete, independent copy of its argument
- **Syntax**
 - `Student Student(const Student&);`

Slide 8- 5

The Need For a Copy Constructor

- **This code (assuming no copy constructor) illustrates the need for a copy constructor**
 - ```
void print_Student(Student john_local)
{ ...}

Student john;
print_Student(john);
cout << john << endl; //memory fault!!!
```

Slide 8- 6

## Calling a Copy Constructor

- **A copy constructor can be called as any other constructor when declaring an object**
- **The copy constructor is called automatically**
  - When a class object is defined and initialized by an object of the same class
  - When a function returns a value of the class type
  - When an argument of the class type is plugged in for a call-by-value parameter

Slide 8- 7

## The Assignment Operator

- **Given these declarations:**  
    Student Mary, Lisa;  
**the statement**  
    Mary = Lisa;  
**is legal**
- **But, there is a problem!**
  - Both Mary and Lisa will point to the same memory location for email\_list and grade\_list.
  - Violation of information encapsulation!
  - More seriously: the program is buggy and will lead to runtime error!

Slide 8- 8

## Overloading =

- **The solution is to overload the assignment operator =**
  - operator = is overloaded as a member function
  - Example: operator = declaration

```
Student operator=(const Student& rhs);
```

- **Demo**

Slide 8-9

## The move constructor

- **Recall: when a function returns a Student object, Student's copy constructor will be automatically called.**
- **Efficiency concern:**
  - The object to be returned has a very short life span
  - Both copy constructor and destructor are called to make a copy of the object and then destroys it.

- **Solution: the move constructor**

```
Student(Student && s); //move constructor
```

//Note: the following implementation is incomplete

```
Student::Student(Student && s):email_list(s.email_list), num_emails(s.num_emails){
 s.email_list = nullptr; s.num_emails = 0;
}
```

10

## Summary

- **If a class contains a dynamic data member, this class must include and implement the Big-3**
  - Destructor
  - Copy constructor
  - Assignment operator
- **Need to understand the necessity of including big-3**
- **The move constructor**

11

## Quiz

- **A program needs to explicitly call a class's destructor to return the allocated memory.**
- **The assignment operator can only be overloaded as a member function.**
- **The copy constructor of class Student will be automatically called when a function has a call-by-value parameter whose data type is Student.**
